

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is a hydraulic device that allows the individual driving to be able to maneuver the lift truck without leaving the seat. They are made out of top quality materials and are designed to be able to endure the most difficult procedures and work environments. Side shifting models have the extra ability to be able to laterally position the arms or the entire load in order to facilitate more precise carrying and position in a quicker and more effective way.

The unique fork pocket design can enable the one operating it to be able to securely swing the unit's forks without any fear of destroying the positioning cylinders. This can allow the operator the choice to either perform simultaneous or independent fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into blade positioners on existing units.
